

## Data Collection and Preprocessing Phase

Date	15 June 2024
Team ID	739995
Project Title	Prediction Of Full Load Electrical Power Output Of A Base Load Operated Combined Cycle Power Plant Using Machine.
Maximum Marks	2 Marks

### Data Collection Plan & Raw Data Sources Identification Report:

Elevate your data strategy with the Data Collection plan and the Raw Data Sources report, ensuring meticulous data curation and integrity for informed decision-making in every analysis and decision-making endeavor.

### Data Collection Plan:

Section	Description
Project Overview	The machine learning project aims to prediction of full load electrical power output of a base load operated combined cycle power plant using Machine. Using a dataset with features such as ambient pressure, relative humidity, exhaust vaccum, ambient temperature and other variables. The objective is to develop a machine learning model that accurately predicts. The objective of this project is to develop a machine learning model capable of accurately predicting the full load electrical power output of a base load operated combined cycle power plant. The prediction model should help in optimizing the plant's performance, reducing operational costs, and improving reliability.

Data Collection Plan	<ul style="list-style-type: none"> <li>● Search for datasets related to hospital readmission prediction.</li> <li>● Prioritize datasets with diverse demographic information.</li> </ul>

Raw Data Sources Identified	The raw data sources for this project include datasets obtained from Kaggle , the popular platforms for data science competitions and repositories. The provided sample data represents a subset of the collected information, encompassing variables such as ambient pressure (AP), relative humidity (Rh), exhaust vaccum(V), ambient temperature(T) and other variables.
